System Brief: Augereau

PHYSICAL DATA

Augereau was the name applied to WX Ursae Majoris A by the French captain of the ESA scout ship that first visited it. The star lies 17.53 light years from Sol, but due to the distance limitations of stutterwarp drive, travel is 22.994 light years and requires four jumps. There are three neighbors accessible by stutterwarp travel: Queen Alice's Star, Neubayern, and DM+20 2465.

The binary system contains two stars, Augereau, and a companion, WX Ursae Majoris B, orbiting at an average of 3 au. The primary is a M2V star, with a radius of 0.464 Sol and a mass of 0.420 Sol. Its average luminosity is 0.0268 Sol, with a stellar effective temperature of 3220°K, and an absolute magnitude of 10.12. The companion is a M8V star with a radius of 0..24 Sol and a mass of 0..24 Sol. Average luminosity is 0.0025 Sol, with a stellar effective temperature of 2425°K, and an absolute magnitude of 15.88.

The primary system has three planets, the companion has one, and two planets orbit the combined system. The life zone of the primary ranges from 0.118 au to 0.237 au; all system bodies are in the outer zone. The life zone of the companion ranges from 0.036 au to 0.073 au; all bodies are in the outer zone.

TRAVEL DATA

The planetary system of the primary, Augereau, consists of three planets with no satellites. The stellar 0.0001 g-gradient of the primary is located at 1.588 au, with a 0.1 g-gradient at 0.051 au. Planets I – III are within the stellar threshold. Stutterwarp discharge is possible at the following system bodies: I and III, in addition to the primary. WX Ursae Majoris B has one planet with no satellites. The stellar 0.0001 g-gradient of the primary is located at 1.200 au, with a 0.1 g-gradient at 0.038 au. Stutterwarp discharge is possible at both the planet and the star. Two planets and two satellites orbit a common center of mass of the A-B system. Stutterwarp discharge is possible at I, I a, and II. Primary discharge is at II, where a French outpost is located.

Augereau I

Planet is a Failed Core body orbiting at 0.30 au with no satellites. Travel distance within threshold is 1.29 au. Stutterwarp discharge is possible from an altitude of 4,184 km.

Augereau II

Planet is Ice Ball body orbiting at 0.54 au with no satellites. Travel distance within threshold is 1.05 au. Stutterwarp discharge is not possible due to sub-surface 0.1 g-gradient.

Augereau III

Planet is a Failed Core body orbiting at 1.08 au with no satellites. Travel distance within threshold is 0.51 au. Stutterwarp discharge is possible from an altitude of 1,543 km.

WX Ursae Majoris B I

Planet is a Failed Core body orbiting at 1.00 au with no satellites. Travel distance within threshold is 0.20 au. Stutterwarp discharge is possible from an altitude of 9,144 km.

System Brief: Augereau

Augereau / WX Ursae Majoris I

Planet is Failed Core body orbiting at 11.41 au with eight satellites. Planet is located beyond threshold. Stutterwarp discharge is possible from an altitude of 14,730 km. Satellites consist of one Rock and one Ice Ball. Stutterwarp discharge is possible at Ia from an altitude of 327 km.

Augereau / WX Ursae Majoris II

Planet is a Desert body orbiting at 25.11 au with no satellites. Planet is located beyond threshold. Stutterwarp discharge is possible from an altitude of 3,573 km. A French outpost is located here, and serves as a way station, providing fuel mined from the ice ball at Augereau / WX Ursae Majoris Ib.

Position: Inside indicates body orbits within the stellar 0.0001G gradient.
T-Travel: The distance that must be traveled within the stellar 0.0001G gradient to reach the body.
01.G: The distance of the 0.1G gradient from the core of the body.
0.1G Altitude: The distance of the 0.1G gradient above the surface of the body. A result of "none" indicates that a usable 0.1G gradient is not available and discharge cannot occur at the body.
